

MITIGATE CYBER AND DEVOPS RISK BEFORE, DURING AND AFTER INCIDENTS

TRANSFORM YOUR DISASTER RECOVERY SITE INTO A VIRTUAL CYBER RANGE

CyberVR™ is a software platform that makes full-scale, extremely realistic, and continuous cybersecurity and DevOps testing possible without affecting production systems, a first in technology risk mitigation.

CyberVR™ creates fully functional copies of production systems in mere minutes without the need for additional infrastructure. Those sandboxes are automatically instrumented and made easily accessible for interactive manipulation by multi-disciplinary teams to optimize workflows, validate change management procedures, and collect evidence of cybersecurity capabilities or weaknesses.

VM2020 and Rubrik work together to:

- **Prove** application resilience under destructive cyber attack scenarios
- **Test and validate** risk containment procedures in a realistic sandbox
- **Shorten** cyber vulnerability detection and remediation times
- **Remediate** cybersecurity findings without fear of system downtime
- **Reduce** patch testing and application validation time to just hours
- **Recover** from severe attacks while retaining key evidence for insurance/governance
- **Mitigate** risks created by frequent DevOps software releases

Prove Your Preparedness. Defend Yourself. Increase Your Confidence.

About Rubrik

Rubrik has developed the world's first Cloud Data Management platform for data protection, search, analytics, archival and copy data management for hybrid cloud enterprises. Fortune 500 companies use Rubrik to manage data at scale while realizing data-driven services anytime, anywhere. Rubrik has been named to Gartner's Cool Vendors in Storage Technologies, 2016 and recognized by Forbes as a Next Billion Dollar Startup. For more information, visit www.rubrik.com and follow @rubrikInc on Twitter.

CyberVR™ Functional Diagram

Ease of access for developers, security teams, pen testers

CyberVR™ takes advantage of efficient snapshot clones to automate the creation, instrumentation, and operation of full-scale datacenter sandboxes that are used to safely discover, assess, mitigate, eradicate, and recover from IT corruption and cybersecurity incidents. Now you can prove application resilience, reduce detection and remediation times, anticipate patching side effects, and provide forensic information required for cyber insurance claims.

Key Components of the CyberVR™ Simulation Platform

| Feature | Description |
|---|---|
|  Production Workloads | Virtualized production workloads are at the core of CyberVR™: it automatically detects which VMs are protected by snapshots and where those snapshots reside. CyberVR™ then automatically reconstructs the VMs that support a workload and their interconnection fabric so that they can run just as if they were in the production environment. |
|  Tight integration with virtualized infrastructure | With efficient Snapshot Clones, enterprises get near-zero RTOs for VMs and databases. CyberVR™ expands their use to also provision, instrument, and operate multiple clones in fully functional sandbox environments for security, change management, and test/dev without a storage penalty. |
|  Functional Isolated Network Bubble | Restored copies of the production VMs combined with built-in software defined networking capabilities provide fully functional yet isolated networks that are easily configured, instrumented, and operated through CyberVR™. Local snapshots of the VMs are taken during simulations, making possible "what-if" analysis and multi-path drill execution. |
|  Integrated Exercises | Pre-packaged tools and exercises can be automatically applied to any simulation, including but not limited to OpenVAS, Metasploit, MBSA, WSUS, mass credential re-issue, full-scale patch installation and validation, etc. CyberVR™ automatically generates operational and compliance reports and performs user-defined application health checks during simulations. |
|  Participants | Multi-disciplinary teams including developers, security analysts, and application can safely deploy and connect to the isolated networks for testing and training using the CyberVR™ self service portal. Access though the hypervisor is also available for system administrators. |

Contact us for a demo or trial and have CyberVR™ up and running in your environment in less than 2 hours
